

# THE PINKHAM VEGETABLE COMPOUND

## OPERATION PREVENTS

By Lydia E. Pinkham's Vegetable Compound

Chicago, Ill.—"I want to tell you what Lydia E. Pinkham's Vegetable Compound did for me. I was so sick that two of the best doctors in Chicago said I would die if I did not have an operation. I had had three operations, and they wanted me to go through a third one. I suffered day and night from inflammation and a small tumor, and never thought of seeing a doctor again. A friend told me how Lydia E. Pinkham's Vegetable Compound had helped her, and I tried it, and after the third bottle was cured."—Mrs. A. E. GALLAGHER, 11 Langdon Street, Chicago, Ill.

If you are ill do not drag along at home or in your office or business until an operation is necessary, but build up the feminine system, and remove the cause of those distressing aches and pains by taking Lydia E. Pinkham's Vegetable Compound, made from roots and herbs.

For thirty years it has been the standard remedy for female ill, and has positively restored the health of thousands of women who have been troubled with displacements, inflammation, ulceration, fibroid tumors, irregularities, periodic pains, backache, bearing-down feeling, flatulency, indigestion, dizziness, or nervous prostration. Why don't you try it?

### WHY HE LIKED TIGHT SHOES

Little Remark That Threw Great Light on the Home Conditions of Amos Dore.

"We always sponsored a little boy Amos Dore and his wife got along—'Aunt Em' Macomber said frankly. 'Some in the neighborhood said they'd never overtaken a single loud or cross word on either side, but Life Daniels always stuck to it that Amos was as misable at home as a man could be."

"He never spoke right out till Amos died and Mrs. Dore went back out-country to her folks. Then he let out."

"What?" queried Aunt Em's visitor.

"Well, Amos worked logging alone side of Life every winter, and summers they had together most all ways, and it seems," said Aunt Em, "impressively, 'that Amos complained of his shoes hurting him about all the time. Finally Life asked why he wore tight shoes."

"Why don't you get a pair big enough?" says Life, one day.

"Well, I'll tell you, Amos says, 'When I wear tight shoes I forget all my other troubles.'—The Youth's Companion.

### A PROUD PAIR.

"What makes that peasant so proud to-day?"

"Oh, he has the biggest rooster in town—and he wears the biggest hat."—Fleegle's Blast.

God bless the man who first invented screens, and God pity the man who is too indolent or indifferent to place them between his family and the spreaders of deadly disease. There is absolutely no excuse for the man or woman whose place of habitation swarms with flies and mosquitoes in the voices of mosquitoes. They can be kept out, and 25 cents spent in keeping them out is equivalent to keeping out a doctor who would cost \$25, or possibly to keeping out a much less welcome visitor.

**DODDS' KIDNEY PILLS**

# THE PRACTICAL FARM BUILDING

Complete Instructions Given for Erection of Structures That Will Accommodate Horses, Cattle, Feed and Other Accessories.

Method of constructing a fresh air intake in an old barn, using an old window or an opening made for the purpose. Fresh air enters A and crosses section B. Outdoor opening for the fresh air, C, is made by using matched lumber, nailed paper and studding. In one way, the fresh air, which enters at D, which functions as the stable, allowing it to enter near the ceiling at D.

The great demand for information relating to the construction of dairy buildings led the dairy division of the United States Department of Agriculture to start a series of investigations for the purpose of developing the basic principles of such construction. In order to make the work thoroughly practical, these studies were extended to the planning and actual supervision of construction of a number of dairy buildings in different sections of the country. The work is still in its formative stages and far from complete, but already promises valuable results in securing better methods of construction. In order to place the matter now available in form for wide distribution and usefulness, a number of plans are here presented, with brief descriptions.

The designs are not intended to represent the only construction available for the purposes indicated, but are intended to be suggestive of certain principles of construction which, by use of the builder's own ingenuity, may be adapted to local conditions. The designs shown represent feasible and economical dairy buildings, and specifications were furnished to builders, and the understanding that they would keep account of the cost of construction and furnish such other data as might be necessary for a complete description of the work.

A detailed description is given of one design, but the principles are largely the same in all of the plans shown. The arrangement of the space can be adapted to the needs of the particular location.

Full pen and box stall. These are approximately 10 feet wide, providing a full window in each stall, providing an abundance of light.

Feed room. This is centrally located; a chute from the silo enters, and also two grain chutes from the upper floor. A hay chute from the loft above deposits the hay in the feeding trough.

Wash room. No dairy barn is complete without a wash room for the milking machine. A hot water boiler for providing hot water and steam is the necessary part of the equipment of a modern dairy barn. Milk scales, record sheets, milk stools, etc., may also be kept there when they are not in use.

Watering. Watering devices may be put in the stable or provided outside at the option of the builder. The silo may be watered in a 14 feet in diameter and thirty-two feet high, and has a capacity of about 110 tons. This will provide silage for a year for six or eight months.

Details of construction of stalls, stanchions, silos, etc., will be found later on.

Stalls or pens so designed that stanchions or chain ties may be used. Builders who desire to use patent stalls will find the arrangement of gutter, platform and feed manger applicable to this respect.

Storage of feed. There is no objection to storage above the cow stalls, provided so long as the feed is kept in construction to the one in the drawing, so as to be kept perfectly dry.

Celling. In colder climates it is deemed better to have a comparatively low ceiling on account of the temperature, and this construction admits of change in this respect.

Ventilation. The plan adapts itself to any system of ventilation. The openings shown give a suggestion of how the fresh air may be taken in and the impure air discharged.

Driveway to second floor. This is located on one side of the barn at the end. The main reason for locating the driveway at this point is because it does not shut out any light from the lower level.

The width of this light is 26 feet 4 inches outside. This allows ample

room for the stalls and passageway, and permits of the most economical use of lumber in building. While the height here shown is 24 feet 9 inches, this depends on the number of cows to be handled. The side walls are built of stone or concrete up to the window sill, the balance of the walls being frame. The end walls are constructed of stone or concrete up to the ceiling. A partition extends across the barn so that the cow stable can be entirely shut off.

**HANDY SELF-FEEDER FOR HOGS**

Works Satisfactorily and Prevents Fights Getting in Feed.

W. E. Gilmore, Henderson Co., Ill., sends an illustration of his method of making a self-feeder for hogs. This feeder is said to work satisfactorily and prevent the hogs from getting their feed filthy.

This self-feeder is attached to the lower side of the corn crib. Our correspondent states that his crib is 16 feet long, 10 feet wide and 10 feet high. In the sketch the self-feeder is represented as it would appear at the location of the crib on one side.

The trough is 16 feet long and made of two boards 12 inches wide—one for the top and the other for the bottom. The board from C to B is on a slant. The holes shown at E, which are just large enough for the hogs to get their noses in, are eight inches apart.

Ten Rules for Spraying—Spray early with Bordeaux mixture, and later with an ammoniacal copper carbonate solution you can buy them ready for use, to prevent rust.

Add resin and fish oil to arsenical and other poisons to cause them to stick to the leaves and softener plants.

Use a powder like slug shot if seeking an easy way to get potato bugs in check.

Spray grapes, raspberries and beans with Bordeaux mixture to prevent Anthracnose.

Use ammoniacal copper carbonate solution when you want a substitute for Bordeaux mixture that will not stain.

To revenge yourself on the corn worm, use a little poisoned bait around such plant. Mix a teaspoonful of Paris green with a cupful of bran.

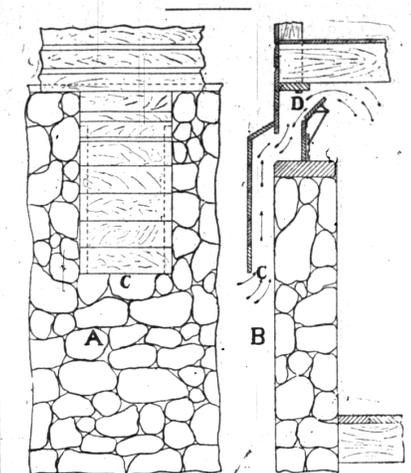

Put the gooseberry and currant bushes with hellebore as soon as the leaves appear and water with dew, to keep the currant worms in check. A second application will be needed a few weeks later. "Hellebore" is a name for six or eight months.

Do not use arsenate of lead (another effective remedy for currant and grape fruit begins to form). Blame the currant for the plum which fall early, which are punctured and show a spot of gum. Circumvent the currant by spraying the trees early in the morning with a stout pole about one end of which burpap (the cause of wormy apples) and prevent injury to the fruits from apple scale and better rot by spraying the trees with Bordeaux mixture containing three pounds of arsenate of lead, as soon as the petals fall. Spray again every three or four weeks until the worms are ripe.—Suburban Life.

Setting Posts.—Any timber will last quite well if set in this way: Dig a square hole about a foot deep, throwing the dirt well back. Sharpen the post and drive well into the bottom, then put a flat stone against each side and a chunk against the post, the boards holding it the other way. This prevents their rotting at the surface of the ground as they always do.

# DETAILED PLAN FOR PRACTICAL FARM BUILDING

Complete Instructions Given for Erection of Structures That Will Accommodate Horses, Cattle, Feed and Other Accessories.

Method of constructing a fresh air intake in an old barn, using an old window or an opening made for the purpose. Fresh air enters A and crosses section B. Outdoor opening for the fresh air, C, is made by using matched lumber, nailed paper and studding. **What you can do on 10 acres**

You have read of the big profits being made by growers in the Gulf Coast Country of Texas. Has it occurred to you to consider what you could do under similar circumstances? Isn't it reasonable to suppose that you can do as well?

If you should go to the Gulf Coast Country of Texas and buy a 10-acre tract this is what you might reasonably expect, if you do as well as the average—for these are not fanciful figures—but the actual average results, carefully figured from the yields of a large number of growers in the Gulf Coast Country of Texas:

WINTER CROPS	SUMMER CROPS—Same Land
3 a Bermuda Onions, \$939.00	2 a Indian Corn, \$ 44.50
1 a Cauliflower, 793.00	
2 a Cabbage, 254.00	
1 a Cucumbers, 390.00	2 a Peanuts, 160.00
1 a Celery, 246.00	5 a Cotton, 310.00
1.2 a Egg Plant, 400.00	1 a Sorghum, 75.00
1 a Peppers, 1000.00	Total yield from 10 a, \$5057.50
10 acres Total \$4468.00	

The expense of raising these crops is not great, for you will not need much help on 10 acres. You can do what others are doing. Go see for yourself. Very low excursion fares twice a month via Rock Island-Frisco Lines. The trip itself will be a pleasure. The climate is a marvel to all—winters mild and sunny—summers pleasantly cooled by Gulf breezes. Can you afford to miss such an opportunity?

Write for full information about the big profit growers are making in the Gulf Coast Country of Texas, and set of colored post cards.
