CHOICE.

"Well," said the head of the family, "it's to a choice between two things."
"And what is that?" asked his wife.
"Whether we'll confinue to eat meat or content of maintain an aptomobile."

FOUND THE LOST MINE

For years and years the prospectors in Sonora.

Mexico, have been searching for the second of what has been recorded in history as the "twin lost mines." In certain old records of the early missions mention is made of two certain lost mines. The names under which they are recorded, like the names of most of the missions entablished under the Spanish crown, do not correspond with any known indimarks today and basis for exploration.

When the San Pedro mine, located sonth of Acozari, was discovered some years ago, with its old underground workings, it is firmly bendised the most office of the second of the famous lost thines had been discovered. Now it seems probable that the second of the famous lost thines has not been discovered in an antiqua mine of great age has been discovered an antiqua mine of great age has been discovered and solve seems of the conditions of the conditions with problems of the conditions of th

the cadet is assigned; campaign certifica-tions; practical knowledge of exployics and the company of the company of the company and tirenomenty; topographic drawing. For the third six months the studies com-prise general tactics or the use of the three weapons, including the application of themes relating to maps for charts of the country; theory and practice with small freatme for artillery; communication and the field, the field, unitary thorography; the field of the company of

round, with proofs enough to indicate that it has not been worked for many years.

The discovery was made by John Guilfoyle, a well-known pioneer mining prospector of Nace zari. When out west of Nacezari about ten miles he came across a piece/of detached ore, which he picked up and examined. He spent many days looking over the neighboring ledges in the hope looking over the neighboring ledges in the hope was in vain. Meantine he brought in the specimen of ore and was surprised to find that it ran 1,370 ounces of silver to the ton, wife good values in gold. This assay ran so high that he returned to the district and continued his search. While using a steel in a creek bottom he found rock falmont at the surface, but continuing his soundings he suddenly struck a spot where the steel sank several feet.

Guilfoyle knew that the reck formation could

inga he suddenly struck a spot where the steel aank several feet. that the rock formation could not have ended so abruptly, and he began to excavate. He uncovered a long cut in the solid rock of the greek bed which held down stream and which could not have been cut there when the water was flowling in the present creek bed, As he progressed he found old stone implements, down across a great affection updates or some order in which the lands of the strength o

tive ores before smelting in their crude dobe fur-naces. Later he uncovered materias, all made of a bard flint rock, while must have near their into the district from a considerable distance, as there is no fittin of this hardness near the mine. After pursuing his work for several days, the drift in the rock led into the ore ledge, but the old workings were found to be closed up solid with 0.5.

Gullfoyle pursued his investigation and found under the soil on the creek upland the remains of an old slag dump. It is customary with the slag subsequence of the propertors in Sonora, fullfoyle at once had this slag assayed. On account of the primitive methods of smelting employed by the ancient workmen the slag found on heave old dumps is usually extra smelters, which leave nothing of value in the slag, but, strange to nipte, in this case the slag was found to be absolutely worthese, indicating that at this mine the gulverizing of the ore had assisted in the extraction of the metal values. The antique smelters also knew a lot about the use of certain chemicals in the extraction of metal from the ore and at this mine probably one of those processes was used in connection with

use of certain chemicals in the extraction of metal from the ora and at this mine probably one of those processes was used in connection with the furnace, only fragments of the foundation of which were found by kecavation.

The finding of the slone tools has caused considerable interest among those of an archaeological turn of mind. The Spaniards were experts the manufacture of seel, so that the tools were not appeared to the seed of the control of the
