THE WINDOW GARDEN

By EREN E. REXFORD. It may not seem reasonable to the reader to treat of window gardens in midsummer...

Look over the window gardens of your neighbors in winter, when they ought to be at their best...

The plants will be small, much too small to be ornamental, and if you keep an eye on them...

What we aim at is flowers in winter—not in the spring, when the blossoms of the outdoor garden are at hand...

Now, this woman's failure to obtain flowers from her plants was explained by three words she made use of—'just before winter'...

The fact is, as anyone will readily see, when they come to think the matter over, a plant cannot be satisfactorily developed in two or three months...

Now, this woman's failure to obtain flowers from her plants was explained by three words she made use of—'just before winter'...

The fact is, as anyone will readily see, when they come to think the matter over, a plant cannot be satisfactorily developed in two or three months...

In order to secure a good collection of good-placed plants for the winter, one must begin to get ready during the summer...

There, I advise the owner of a collection of house plants when which she wishes to secure flowers all through the winter season...

Reports now, if necessary, and shift such as seem to head larger pots. If young plants are to be used, procure them at once and keep them going ahead steadily.

Do not be so anxious to secure large pots that you fall into the error of over-feeding. Simply aim to bring about a strong, healthy growth, and as long as a plant seems to be

Speemlin Polypodium Mandalanum.

making such growth do not make use of the fertilizers.

It is one of the hardest things I know of to make an enthusiastic amateur plant grower satisfied to 'let well enough alone'.

A plant that does not get as much food as it can take good use of, will give vastly greater satisfaction in the long run than the plant that gets too much food and it doesn't know what to do with it.

Some persons are under the impression that all plants for winter use must be young ones. Such is not the case, however. Young-old plants, as a general thing, are much preferable to the young ones.

There are exceptions as in the case of Chinese primroses, Primula obtusica and others of a habit similar, in some respects to our annuals, but for the most part, they are adapted to house culture like geraniums, heliotropes, begonias, arabidons, asparagus in variety and carnations, older plants being especially to be chosen.

This summer I start the geranium which I intend to depend upon for winter flowers a year from the coming winter. They will bloom some of the winter if I let them, but I shall hold them in check to a great extent for future service.

The person who preaches 'young plants for winter flowering' to you does not take into consideration the fact that a plant started this season from a cutting will have but few leaves and but few branches when the more flowers can be expected.

Therefore, instead of letting the geranium you start this summer bloom in the winter, keep pinching them back to produce a sufficient number of branches to give the desired amount of flowering surface.

The more branches there are the more flowers you may expect. Cut your ferns apart now and use each division of the roots that has a piece of crown attached as the basis of a new plant.

Use leaf mold or tarry loam for this class of plants, if obtainable. Hanging baskets should receive attention at once.

Some helpful hints. Roses of all kinds should be thoroughly manured with well-rotted cow manure and mulched with lawn cuttings and leaves.

Liquid manure should be applied on the ground the most enough to absorb it. It is fatal to some plants to fertilize them with rich manure when the ground is very dry.

Never allow roses to remain on the bush until the petals begin to fall. All plants that are intended for winter bloomers should have the buds pinched off now.

Pick the pansies and nasturtiums every day if you want to have plenty of bloom.

MULCH YOUR PLANTS. If the season is warm and the soil seems likely to dry out rapidly, water your plants well, and mulch about them with road dust.

Do not be so anxious to secure large pots that you fall into the error of over-feeding. Simply aim to bring about a strong, healthy growth, and as long as a plant seems to be

GO SLOW IN FEEDING NEW CORN TO HOGS

Healthy, Vigorous Bunch of Hogs.

With new corn the greatest danger is in overfeeding. Farmers who have old corn...

The first two months must be spent in building up a frame work and constitution which will carry a load of fat...

The wise feeder does not figure so much on the amount of fat he can put on his hogs...

The farmer who has a hundred acres of corn and no clover pasture or alfalfa...

We all know that corn is the most fattening feed that can be used but many of us have not yet learned that constant and heavy feeding...

When a hog is stuffed with corn and nothing else, he soon becomes overfatted and his growth stops...

Destroy white fly on tomato plants. Department of Agriculture recommends fumigation with Hydrocyanic Gas.

For white fly on tomatoes the experts of the department of agriculture recommend fumigation with hydrocyanic gas...

Make profit with sheep on any farm. Properly cared for, they have fewer ailments than any other farm animal.

For the man who has rough or poor land with short pastures, sheep are much more profitable than cattle.

Harness oiling is a job for rainy day. Little use in all kinds of weather works a great change in flexibility.

Harness oiling is a rainy day job on the farm and a regular part of the stable work in the city.

Chicken driver is not hard to make. Simple Palm Leaf Fan Wired to Long Stick Will Prove Tirely Satisfactory.

Not very easy to drive young chickens where they don't want to go. 'Shooting' with the apron...

God's Place for Cows. The little cow that most has a yard with some trees in it...

Storing Vegetables. Late-season carrots, beets, etc., stored in a cool, dark place...
