

REMARKABLE RECOVERY

Extraordinary Curative Power of Lydia E. Pinkham's Vegetable Compound.

Philadelphia, Pa. "I want to let you know what good Lydia E. Pinkham's Vegetable Compound has done for me. I had organic troubles and am going through the change of life. I was taken with a pain in my side and a bad headache. I could not get to sleep. I suffered something terrible and the doctor's medicine did me no good at all. My pains got worse instead of better. I began taking the Vegetable Compound and felt a change from the first. Now I feel fine and advise any one going through the change of life to try it, for it cured me after I had given up all hopes of getting better. You can publish this and I will tell any one who writes me the good it has done me." Mrs. MAHAUER DANZ, 743 N. 25th Street, Phila., Pa. It hardly seems possible that there is a woman in this country who will continue to suffer without giving Lydia E. Pinkham's Vegetable Compound a trial after all the evidence that is continually being published, proving beyond contradiction that this grand medicine has relieved more suffering among women than any other medicine in the world.

Vaseline PETROLEUM JELLY

For burns, cuts, sprains and all skin irritations. Relieves dryness of scalp.

REFUSE SUBSTITUTES

CHESEBROUGH MFG. CO. State Street New York

FRECKLES! REMOVED BY THE BEST OF THE WORLD'S SKIN TREATMENT.

Mr. S was ill with a cold, and the doctor who was summoned prescribed old-fashioned remedies. Cautious and cautious internally and antipneumonic to be applied externally.

MURINE Night and Morning. Your Eyes. Your Eyes. Your Eyes.

CONCRETE FLOORS FOR FEEDING CORN TO HOGS WILL SAVE MONEY

Forms for a Concrete Feeding Floor.

The high prices of feedstuffs have turned the farmer's attention to means whereby the cost of feeding corn to hogs may be decreased. It has been found that there is a saving in corn when it is fed on a properly constructed feeding floor. Old plank or wood floors are not desirable, as they fly dirt and burrs for rats and hogs. Concrete feeding floors do not have this objection. They also are an aid in the conservation of fertilizer and in the sanitation of the feed lot. The fall days, before harmful frosts set in, offer an excellent time for the construction of such a floor.

The site of the feeding floor should be well drained and situated conveniently with respect to the feed supply, water, barns and lots. Where the ground never freezes, drainage from ditches are unnecessary. If the location selected is poorly drained, provision should be made for good under-drainage. The floor must be graded, or sloped so that water will not collect and freeze on it in winter and so that manure washings may be caught and carried by the water to a septic tank or a septic concrete manure pit.

The methods of constructing the several kinds of concrete feeding floors are unnecessary. If the location selected is poorly drained, provision should be made for good under-drainage. The floor must be graded, or sloped so that water will not collect and freeze on it in winter and so that manure washings may be caught and carried by the water to a septic tank or a septic concrete manure pit.

Use Clean Sand and Gravel. Sand for concrete should be clean and should have grains grading in size from fine to coarse.

Full details and instructions for building concrete feeding floors are found in Farmers' Bulletin No. 848, "Concrete on the Livestock Farm." This bulletin also contains other suggestions of interest to the live-stock farmer. It may be obtained by addressing the Division of Poultry and United States Department of Agriculture at Washington.

A fairly rich mixture makes the best concrete floor. A good mixture consists of one part Portland cement, one and one-half parts sand and five parts screened gravel or crushed rock. One bag of cement may be considered as holding one cubic foot of loose concrete. This is a convenience in measuring the proper proportions as the cubic foot may be used as a unit in measuring the aggregate.

In mixing the concrete, the cement, sand and gravel should be thoroughly mixed in a dry state until the mass is of uniform color. Just enough water should be added so that a small amount of water will appear on the top when the concrete is well mixed in place.

Proper Curing of Important. Proper curing is through making of the concrete. In hot weather each newly laid section should be shaded from the sun and covered with a coarse material, such as straw or hay, so that the water will not wash out. The surface should be shaded with water during and soon for a week after the floor has been laid. The floor should be covered with a coarse material, such as straw or hay, so that the water will not wash out. The surface should be shaded with water during and soon for a week after the floor has been laid.

The construction of feeding floors is similar to that used in building on concrete. In hot weather each newly laid section should be shaded from the sun and covered with a coarse material, such as straw or hay, so that the water will not wash out. The surface should be shaded with water during and soon for a week after the floor has been laid.

This bulletin also contains other suggestions of interest to the live-stock farmer. It may be obtained by addressing the Division of Poultry and United States Department of Agriculture at Washington.

MANY FAILURES DUE TO RUBBER

Some Tests Recommended by Department of Agriculture to Find Reliability.

POOR RINGS CAUSE TROUBLE

Four Inches of Rubber Should Stretch to Ten Inches and Then Return to Original Length - Sample Should Not Break.

The rubber, which already had been tested by cutting a ring on the hooked screen door to see if rattling it would annoy her neighbor. When Mrs. Jessup appeared at the basement door, in her arms were a number of jars of canned fruit, and she looked so disturbed that her caller wondered what had happened.

"Have you been standing there long?" she inquired. "I'm sorry I didn't hear you knock. But I was so upset at what I found in my storage closet this morning that I guess if the Angel Gabriel had sounded his trumpet, I wouldn't have heard him."

When the rubber rings were tested, it was found that they were not reliable. The tests showed that the rubber rings were not reliable. The tests showed that the rubber rings were not reliable. The tests showed that the rubber rings were not reliable.

GRAPE JUICE USEFUL TO FLAVOR DESSERTS. Ample Supply Is Easily Obtained by Housekeeper.

Unfermented Product, Properly Made and Bottled Will Keep for Indefinite Period if Not Exposed to the Atmosphere.

Wise housekeepers can have plenty of grape juice for use in a variety of beverages but in flavoring in various tempting desserts. The following directions for making it are given by the United States Department of Agriculture.

One cup of seed, well washed and not overripe grapes, should be put in a bowl and crushed by a potato masher or some similar implement or the juice may be pressed out in an ordinary rubber masher. The juice should be strained through a cloth and the pulp pressed out. The juice should be strained through a cloth and the pulp pressed out.
