## Wife Savers

A clean steel pot scraper may be used to scrape carrots. Use with a circular movement. It is quicker and more effective than a knife. Potatoes for baking may be scrubbed in the same way.

And if he counts or makes mistakes, don't scold him. Don't make him feel he should be ashamed. Make it not a matter of blame at all. Just show him how to learn these items with efficiency. Write out the whole combination (including answer) of those he has trouble with, attacking only four or five at a time. It may be better to help him make cards of them with the whole combination on one side and the partial combination on the other. Have him say over and over to himself the complete combination as 12 and 7 are 16", as he looks at all of it. Persuade him never to hurry or guess, and not to attack more than five or six of these combinations at a sitting.

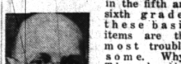

I wish parents would also do all these things. I have advised the teacher. Remember, no show of irritation, no sign of rebuke, no suggestion of haste. The moment you feel de-

mistakes as well as correct responses. Let me beg the teacher of the intermediate grades to check each child individually on the simple number facts in addition, subtraction, multiplication. If you can make him feel entirely relaxed and unafraid, you can soon ascertain the nature of any trouble he may have with these matters.

In case he pauses or makes errors with these combinations, get him to tell you what went on in

## Child's Arithmetic Woes Are Needless, Myers Says

MOST TROUBLE children have over arithmetic should never happen, since the bulk of it is over such very simple matters as 4 plus 8, 15 minus 6, and 8 times 7. Even in the fifth and sixth grades these basic items are the most troublesome. Why? The learning has been retarded by unpleasant emotions, chiefly fear. The child has had to hurry. He had never learned these items with precision, and his drill, or practice, has been repetition of mistakes as well as correct responses.

Dr. Garry C. Myers

I wish parents would also do all these things. I have advised the teacher. Remember, no show of irritation, no sign of rebuke, no suggestion of haste. The moment you feel de-

mistakes as well as correct responses. Let me beg the teacher of the intermediate grades to check each child individually on the simple number facts in addition, subtraction, multiplication. If you can make him feel entirely relaxed and unafraid, you can soon ascertain the nature of any trouble he may have with these matters.

In case he pauses or makes errors with these combinations, get him to tell you what went on in

And if he counts or makes mistakes, don't scold him. Don't make him feel he should be ashamed. Make it not a matter of blame at all. Just show him how to learn these items with efficiency. Write out the whole combination (including answer) of those he has trouble with, attacking only four or five at a time. It may be better to help him make cards of them with the whole combination on one side and the partial combination on the other. Have him say over and over to himself the complete combination as 12 and 7 are 16", as he looks at all of it. Persuade him never to hurry or guess, and not to attack more than five or six of these combinations at a sitting.
