Rickets
Rickets is a disease of young animals characterized by impaired nutrition of the entire body and manifested by changes in the growth of bones leading to marked deformity.
It is a widespread condition affecting as a rule puppies at weaning time when the character of the food is suddenly changed. It is also more common in the larger breeds of dogs.
There are various causes:
(1) Deficiency of lime salts.
(2) Improper utilization of lime salts.
(3) Digestive disturbances.
(4) Diet too rich in starches.
(5) Infections.
(6) Lack of sunlight.
(7) Heredity.

The common recognizable symptom is the deformation of the bones, and if the condition remains uncorrected the animal may become severely ill with no hope for recovery. Also, since there is marked deformity while the condition may be checked—it is difficult to treat.
Prevention is much to be preferred. This is undertaken initially before the puppies are born by caring for the pregnant bitch. Her diet should be proper and contain the calcium and phosphorus minerals plus lots of sunshine or if necessary Vitamin D. These essentials are to be continued through her period of lactation also.
When the puppy is weaned he should have certain vitamin-mineral supplements added to his diet, especially during the winter months.
