The term "mother earth" is frequently on the lips of many of us. Too often, however, we take for granted the soil upon which we tread in our daily rounds ignoring our tremendous dependence upon its fertility and the unseen plant and animal life which it supports. which we tread in our daily rounds ignoring our tremendous dependence upon its fertility and the unseen plant and animal life which it supports.

Soil is as old as the first land plants whose ancient growth began its slow accumulation. Scientists believe that lichens, those primitive grey-green scale—like bodies which still grow on soil and bark and stone, are typical of these early plant populations.

NOW AS THEN soil continues to underso an intricate and constant evolution resulting from its relationship to the plants and animals which it supports as well as to the many natural and climatic forces by which it is after the strength of the soil which makes up the thin outer covering of our roof. On any day afield take up a handful of soil which makes up the thin outer covering of our roots of the soil is organic matter which is composed of the residue of once the soil is organic matter which is composed of the residue of once the soil is organic matter which is composed of the residue of once

oNLY FIVE TO 10 per cent of the soil is organic matter which is composed of the residue of once living plants and animals.

If you use a little imagination you can interpret this to mean such things as a dead leaf, a mouse'a skull, a bird's feather, a snake's skull, a bird's feather, a snake's constant of the control of the control of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the control of the control of the control of the state of the control of the co

its most important factor is the breaking down of the above organic wastes into the enriching substances which we call humus.

THE TERM "soil life" is one hich live either on or under its

which live claims of surface.

It is only within recent years that this study called "soil biology" has claimed the attention of scientists. Their explorations are giving us tantalizing glimpses of a new field filled with amazing variety and

filled with amazing variety and complexity.

FOR INSTANCE, John Russel, author of "The World of the Soil", estimates that a texapon-ful of fertile and the soil of the soil of the world.

And Farb points out that a single bacterial cell producing a new generation every twenty minutes could in only two days theoretically give rate to 24 trillion trillion property, weight of the earth itself. Fortunately, natural checks and balances make such runaway growth impossible.

make size runawy grown impos-sible. MAINTENANCE of an additional supply of soil nitrogen is of the principal problems of the earth's fertility. Large amounts of this substance are removed from crop. fields whose products in turn nourish animals and men. Although a part of these waste materials is returned to the soil as fertility, much of the nitrogen is lost. The chief means of returning nitrogen to the soil is by the activ-
